

NETMESSENGER API EXAMPLES

FASTSMS (A Division of NetSecrets Ltd)
Ayrton House, Buntsford Park Road, Bromsgrove, Worcestershire, B60 3DX
Tel: 0800 954 5305 Email: helpdesk@fastsms.co.uk

The following pages contain sample code we have produced to assist you in building FASTSMS functionality into your development environment. We are always adding new items to both our API's and our examples library so for the latest versions please visit our website's resource area or access the latest examples via your Netmessenger account. Login on the following URL; <http://login.fastsms.co.uk/examples.php>

Currently this document supplies example code for the following;

■ **PHP**

■ **ASP**

■ **XML**

If you have any other requirement or would like to feedback to us your ideas or comments please email us at helpdesk@fastsms.co.uk or call **0800 954 5305** and speak to one of our operators.

PHP API Examples

Note: All of these examples use the api_connect() function (within these examples).

URL: <http://login.fastsms.co.uk/examples.php?language=php>

Sending a message with the API

```
<?php  
  
// Create Parameter Array  
unset($Parameters);  
$Parameters['Action']="Send";  
$Parameters['DestinationAddress']="447777777777";  
$Parameters['SourceAddress']="System";  
$Parameters['Body']="This is a test message";
```

```

$Parameters['ValidityPeriod']="86400";

// Call api_connect() function
$resultcode=api_connect("MyUserName",           "MyPassword",
$Parameters);

if ($resultcode>0)
{
echo "Message ID is: ".$resultcode;
}
else
{
echo "An error occurred. ID: ".$resultcode;
}

?>

```

Checking Your Credit Level

```

<?php

// Create Parameter Array
unset($Parameters);
$Parameters['Action']="CheckCredits";

// Call api_connect() function
$resultcode=api_connect("MyUsername",           "MyPassword",
$Parameters);

if (is_numeric($resultcode) && $resultcode<0)
{
echo "An error occurred. ID: ".$resultcode;
}
else
{
echo "Current Credit Level: ".$resultcode;
}

?>

```

Checking the status of a message

```
<?php

// Create Parameter Array
$Parameters['Action']="CheckMessageStatus";
$Parameters['MessageID']=0000000001;

// Call api_connect() function
$resultcode=api_connect("MyUserName", "MyPassword",
$Parameters);

if (is_numeric($resultcode) && $resultcode<0)
{
echo "An error occurred. ID: ".$resultcode;
}
else
{
echo "Message Status is: ".$resultcode;
}
?>
```

Running a report

```
<?php

// Create Parameter Array
unset($Parameters);
$Parameters['Action']="Report";
// Possible report types are: Outbox, Messages and Usage
$Parameters['ReportType']="Messages";
// From and To timestamps are in the format
YYYYMMDDHHMMSS
$Parameters['From']="20060101000000";
$Parameters["To"]="20060101235959";

// Call api_connect() function
$reportBody=api_connect("MyUserName", "MyPassword",
$Parameters);

if (is_numeric($reportBody) && $reportBody<0)
```

```

{
echo "An error occurred. ID: ".$reportBody;
}
else
{
echo "Report Follows:\n".$reportBody;
}
?>
```

Creating a User (admin only)

```

<?php

// Create Parameter Array
unset($Parameters);
$Parameters['Action']="CreateUser";
$Parameters['ChildUsername']="user023321";
$Parameters['ChildPassword']="securePassword";
// Access Level : Normal or Admin
$Parameters['AccessLevel']="Normal";
$Parameters['Name']="Customer Name";
$Parameters['Email']="customer@emailaddress.com";
// How many credits do we give this user initially?
$Parameters['Credits']="30";

// Call api_connect() function
$resultcode=api_connect("MyUserName",           "MyPassword",
$Parameters);
if ($resultcode>0)
{
echo "User created";
}
else
{
echo "An error occurred. ID: ".$resultcode;
}
?>
```

Managing User Credits (admin only)

```
<?php

// Create Parameter Array
$Parameters['Action']="UpdateCredits";
$Parameters['ChildUsername']="user023321";
// Give the user 10 credits. You can also use -10
// to remove credits from a user.
$Parameters['Quantity']=10;

// Call api_connect() function
$resultcode=api_connect("MyUserName", "MyPassword",
$Parameters);

if (is_numeric($resultcode) && $resultcode<0)
{
echo "An error occurred. Code: ".$resultcode;
}
else
{
echo "Credits Transferred";
}
?>
```

api_connect function

```
<?php
// api connect function
function api_connect($Username, $Password, $ParameterArray)
{
// Create the URL to send the message.
// The variables are set using the input from an HTML form

$err = array();
$url = "api.fastsms.co.uk";
$headers = "POST /api/api.php HTTP/1.0\r\n";
$headers .= "Host: ".$url."\r\n";

// Create post string
// Username and Password
```

```

$poststring = "Username=".$Username."&";
$poststring .= "Password=".$Password;

// Turn the parameter array into the variables

while (list($Key, $Value)=@each($ParameterArray))
{
$poststring .= "&".$Key."=".urlencode($Value);
}

// Finish off the headers
$headers .= "Content-Length: ".strlen($poststring)."\r\n";
$headers .= "Content-Type: application/x-www-form-urlencoded\r\n";

// Open a socket
$http = fsockopen ($url, 80, $err[0], $err[1]);
if (!$http)
{
echo "Connection to ".$url.":80 failed: ".$err[0]." (".$err[1].")";
exit();
}

// Socket was open successfully, post the data.
fwrite ($http, $headers."\r\n".$poststring."\r\n");

// Read the results from the post
$result = "";
while (!feof($http))
{
$result .= fread($http, 8192);
}

// Close the connection
fclose ($http);

```

	<pre> // Strip the headers from the result list(\$resultheaders, \$resultcode)=split("\r\n\r\n", \$result, 2); return \$resultcode; } ?></pre>
Example HTML form and PHP code for sending a message	<pre> <?php \$header=<<<EOT <!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"> <HTML> <HEAD> <TITLE>Send a Message</TITLE> </HEAD> <BODY> EOT; \$footer="</BODY></HTML>"; if (\$_GET['Action']=="Send") { // api connect function (Note: For a live application you may) // wish to place this function in a separate file and include it // here) function api_connect(\$Username, \$Password, \$ParameterArray) { // Create the URL to send the message. // The variables are set using the input from an HTML form \$err = array(); \$url = "api.fastsms.co.uk"; \$headers = "POST /api/api.php HTTP/1.0\r\n"; \$headers .= "Host: ".\$url."\r\n"; // Create post string // Username and Password \$poststring = "Username=".\$Username."&";</pre>

```

$poststring .= "Password=". $Password;

// Turn the parameter array into the variables

</HTML>

```

XML API Version 1.0

The XML API allows you to perform various actions such as sending and receiving messages, credit information and contacts.

A valid XML API request consists of an authentication section followed by as many other sections as required in any order. For example, in one API request, you could send one message to three recipients, another message to another recipient, check your inbound messages and add a contact.

The XML Document should be posted uriencoded, with a UTF-8 character set as parameter 'xml' to <http://login.fastsms.co.uk/api/xmlapi.php>

Note: Test form & error codes available at <http://beta.fastsms.co.uk/examples.php?language=xmlapi>

Authentication

Authentication is required for every XML API call. This is also included in all further examples below in order to make them complete examples.

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>
</apirequest>
```

Example Responses

Possible values for status are:loggedin, rejected, failed. Success Example:

```
<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>

<userresponse>
```

```
<status>loggedin</status>
<userid>4</userid>
</userresponse>
</apiresponse>
```

Failure Example:

```
<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>
<userresponse>
<status>rejected</status>
<userid>0</userid>

<error>
<code>-501</code>
<message>Unknown Username/Password</message>
</error>

</userresponse>

</apiresponse>
```

Sending a Message

Note that the "batch" attribute of <sendsms> is not stored in the system, it is simply used as a method in which to differentiate responses.

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>

<sendsms batch="[numeric]">
<source>[alphanumeric]</source>
```

```

<destinations>
  <destination ref="[alphanumeric]">[number]</destination>
  <contact ref="[alphanumeric]">[ID]</contact>
  <list ref="[alphanumeric]">[ID]</list>
  <!-- ... (at least one and as many of the above three as required) --
>
</destinations>

<message>[alphanumeric]</message>

<!-- Optional parameters -->

<sourceton>[number]</sourceton>

<schedulefor>[time/date]</schedulefor>

<udh>[UDH]</udh>
<dcs>[DCS]</dcs>
<validityperiod>[numeric, seconds]</validityperiod>

</sendsms>
</apirequest>

```

Example Response

In this example, a message was sent to one number, two contacts and two distribution lists.

Note that when sending to a distribution list, the Number and Message ID for the last message in the list is returned.

```

<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>
  <userresponse>
    <status>loggedin</status>
    <userid>4</userid>

  </userresponse>

```

```
<smsresponse batch="1">

<destination number="447777777778" ref="dest1">
<messageid part="1">18003466</messageid>
<status>sent</status>
</destination>

<destination ref="contact1">
<error>
<code>-200</code>
<message> Invalid Contact</message>
</error>
</destination>

<destination number="447777777779" ref="contact2">
<messageid part="1">18003467</messageid>
<messageid part="2">18003468</messageid>
<status>sent</status>
</destination>

<destination ref="list1">
<error>
<code>-408</code>
<message>Distribution List is Empty</message>
</error>
</destination>

<destination number="447777777776" ref="list2">
<messageid part="1">18003469</messageid>
<messageid part="2">18003470 </messageid>
<status>sent</status>
</destination>
</smsresponse>

</apiresponse>
```

Checking Your Credit Level

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>
<creditcheck />
</apirequest>
```

Example Response

```
<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>
<userresponse>
<status>loggedin</status>
<userid>4</userid>
</userresponse>

<creditcheckresponse>173.69</creditcheckresponse>

</apiresponse>
```

Checking the Status of a Message

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>

<messagestatuscheck>
<messageid>[numeric]</messageid>
<messageid>[numeric]</messageid>
</messagestatuscheck>

</apirequest>
```

Example Response

Click to see a Status List

These are the standard status messages. Any other status should be treated as failed.

- Unknown Message ID
- Pending
- Sent
- Delivered
- Undeliverable
- Rejected

```
<?xml version="1.0" encoding="UTF-8" ?>

<apiresponse>
<userresponse>
<status>loggedin</status>
<userid>4</userid>
</userresponse>

<messagestatuscheckresponse>
<message>
<messageid>2</messageid>
<status>Unknown Message ID</status>
</message>
<message>
<messageid>18003448</messageid>
<status>DELIVERED</status>
</message>
</messagestatuscheckresponse>
</apiresponse>
```

Contacts

It is possible to manipulate the contacts stored in your account. You can retrieve all contacts and/or manipulate specific contacts.

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>
```

```

<contacts>
    <!-- optional, to get all contact ids or all contact ids and details -->
    <retrieveallcontacts mode="[id|full]" />

    <!-- the ref is used to tie the response to the request only, not
        stored -->
    <contact action="[create|edit|retrieve]" ref="[alphanumeric]">
        <contactid>[numeric, only for edit and optional for
        retrieve]</contactid>
        <name>[alphanumeric, only for create or edit]</name>
        <number>[alphanumeric for create or edit, optional for
        retrieve]</number>
        <email>[alphanumeric, only for create or edit]</email>
    </contact>
    <contact action="[create|edit|retrieve]" ref="[alphanumeric]">
        <contactid>[numeric, only for edit and optional for
        retrieve]</contactid>
        <name>[alphanumeric, only for create or edit]</name>
        <number>[alphanumeric for create or edit, optional for
        retrieve]</number>
        <email>[alphanumeric, only for create or edit]</email>
    </contact>
    <!-- ... -->
</contacts>

</apirequest>

```

Example Response

Status will only ever be Saved. If there was an error saving, then you will see the message inside <error>

```

<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>
    <userresponse>
        <status>loggedin</status>
        <userid>4</userid>

```

```
</userresponse>

<contactsresponse>

<-- Response to retrieveallcontacts -->

Check for Inbound Messages

Returns all inbound messages since (not including) lastid and the date specified in the from attribute (format: YYYY-MM-DDTHH:MM:SS+/-TZ:TZ example: 2009-05-09T13:23:50+01:00). If no date is specified, the system will look for messages received in the last 7 days.

```
<?xml version="1.0"?>
<apirequest version="1">

<user>
<username>[alphanumeric]</username>
<password>[alphanumeric]</password>
</user>

<inboundcheck lastid="[numeric]" from="[xml date/time]"/>

</apirequest>
```

Example Response

```
<?xml version="1.0" encoding="UTF-8" ?>
<apiresponse>
<userresponse>
<status>loggedin</status>
<userid>4</userid>

</userresponse>

<inboundcheckresponse>
